

ES-1200iS Transparent Silk Advantages

The ES-1200iS Transparent Silk tweeter brings a new higher level of performance to dynamic dome tweeters. The charts shown here compare the CDT ES-1200iS with a famous make tweeter claiming a response to 50 kHz and extra wide dispersion

The ES-1200iS achieves exceptional performance by the structure of the formed film in the dome not because of the shape of the dome which is conventional

In the accompanying graphs the blue line on top is the ES-1200iS and the red line below is the famous make unit. Notice that the ES-1200iS is more sensitive and stays with the famous make all the way up to 50,000Hz

Notice especially in the 45 degree graph the ES-1200iS has a flat response all the way to 15 kHz. This is amazing performance that has audible consequences.

Openness and clarity are enhanced because the power response is improved compared to conventional drivers.
